Welcome to the May edition of Field Notes. Spring is in full swing, and we know you are working hard to make every pass count. **How can we help you do more with less this season?** That is the question driving our team right now as we focus on bringing the dealership directly to your farm gate.

Inside this month's newsletter, we share practical ways to keep your operation moving forward. You will find expert **tips to optimize your sprayer** and maximize yields. We want to ensure you have exactly what you need when it matters most, so we have also included special promotions on parts and planters.

We are truly grateful for the opportunity to be a partner in your success.

Maximize Your Yields

Sprayer optimization tips from AgRev's Matt Dintelmann

As summer approaches and crops are coming up, it's time to shift focus to protecting your fields. Post-emergent application can keep your crops healthy, but getting

sprayer settings dialed in is crucial to maximize your yields and control input costs.

Matt Dintelmann (a.k.a. Terragator Matt on TikTok) works with AgRev customers to maximize efficiency, and he shared these tips to help you get the most out of every pass.

Tips for Optimal Sprayer Performance

- **Follow product labels:** Always consult the herbicide or insecticide product label for specific tip and droplet size recommendations. Using the wrong size spray tips for speed and conditions is one of the most common mistakes we see customers make. Droplets that are too fine risk chemical drift that can damage neighboring fields. Conversely, if droplets are too coarse, the product may roll right off the leaf and reduce effectiveness.
- **Watch your boom height:** Consistent sprayer boom height is critical to create an even spray pattern across the field, and to reduce damage from the boom striking the ground. Make sure your boom height control system is calibrated and functioning properly.
- **Monitor tip wear:** Over time, as liquids flow through your spray tips the orifice slowly expands, changing the flow rate. Pay close attention to how many gallons have passed through them and replace your tips once the flow rate exceeds that of a new tip by 10%.
- **Calibrate regularly:** Check to ensure product is spraying evenly out of every nozzle. You should use a sprayer calibration tool to measure the exact output of your tips, and fully calibrate your machine at least once per season.
- **Prioritize cleanliness:** Make sure your product tank and boom system are thoroughly cleaned between chemical changes. This reduces the potential for carryover and crop damage. Advanced setups, like the LiquidLogic system available on the Fendt Rogator, are designed to make this cleanout process simple and highly efficient.
- **Consider advanced technology:** Upgrading your machine with a pulse width modulation (PWM) system provides superior control over your application rates and droplet sizes, ensuring exact coverage regardless of your travel speed.

Best Planter Prices of the Year

It's never too early to start thinking about the next planting season. Come see us this month for the **best prices of the year** on planters and get **guaranteed delivery** before the 2027 season begins.
